from the Alliance for Access to Computing Careers

Increasing opportunities for people with disabilities

January 2010

New Directions in Accessible Computing

by Richard Ladner, *AccessComputing* PI and Co-Director

This fall, I spoke about accessible technology in my “New Directions in Accessible Computing” lecture at North Carolina State University (NCSU). My talk was part of the Triangle Computer Science Distinguished Lecturer Series. It was telecast to Duke University and the University of North Carolina.

In my talk, I described ways that people with disabilities can use technology to create or configure their own accessibility solutions. This non-paternalistic approach respects the ability of persons with disabilities to determine their own destinies.

Highlights of this issue:

Summer Academy	2
Summer Computing	2
WebAnywhere: Accessible Accessibility	3
Computing Internships.....	4
Technology, Disability, Developing World.....	5
Robots and Sound	5
Talking Points: Universal Design	6
HTML5 Super Friends.....	7
Top Ten Degrees	7
<i>AccessComputing</i> Minigrants	7
About <i>AccessComputing</i>	8

*To reduce printing costs and yet still share exciting news from *AccessComputing*, an expanded version of *AccessComputing News* is online at www.uw.edu/accesscomputing/jan10_index.html.*

Engage in *AccessComputing*

Students with disabilities:

- Internships
- E-mentoring
- *AccessComputing* Team
- Summer programs

Educators & employers:

- Host an intern
- Communities of practice
- E-mentoring

www.uw.edu/accesscomputing/

For example, if a person who is blind uses an iPhone they can download accessible applications using the phone's VoiceOver feature. New technology is also being developed that allows the user to access phone content through vibrations that represent Braille characters.

Before my lecture, I was able to connect with NCSU students, faculty, and staff. I met Sina

Bahram, an NCSU computer science Ph.D. candidate who is blind. I learned about various projects at NCSU, University of North Carolina, and Duke that may have a future impact on people around the world, including those with disabilities.

2009 Summer Academy students visit Adobe.

Summer Academy

by Rob Roth, *AccessComputing Staff*

A large crowd of family, friends, and community members attended the Community Premiere to honor the ten students who finished the nine-week 2009 Summer Academy for Advancing Deaf and Hard of Hearing in Computing. Held at the University of Washington, this event showcased the animated films the students created. These animation shorts can be viewed at <http://www.uw.edu/accesscomputing/dhh/academy/projects.html>.

Of course at the Summer Academy it was not always nose to the grindstone working on films and attending computer programming classes. Students also went on field trips to Adobe, Google, Intel, Microsoft, and Valve, where they met employees who are deaf and hard of hearing and work in computing fields. They met the president of Valve and previewed a new game weeks before its release to the general public. Summer Academy

students met guest speakers who were deaf and hard of hearing from companies including Viable Video Relay Service, CSDVRS, Oracle, Cray, Group Health, DeafCode, and IBM. The speakers discussed computing jobs and accessible workplaces. Besides academic and career preparation work, the students socialized during activities that included a Ride the Ducks boat tour and a Mariners baseball game.

Academy participants were from Alaska, Arkansas, Indiana, Maine, Maryland, Texas, Virginia, and Washington. Three were high school students, two were in college, and the rest were recent high school graduates. In addition, two students from the 2008 Summer Academy worked as animation tutors and took a more advanced computer science course than they took in 2008. A student who is deaf from Rochester Institute of Technology (RIT) was hired as a teaching assistant for computer programming courses and a resident assistant in the dorms. Additionally, Pam Siebert from IBM in Kansas City stayed for four weeks as a programmer-in-residence. [See the complete article in the expanded version of *AccessComputing News* at http://www.uw.edu/accesscomputing/jan10_index.html.]

Summer Computing Experience

by Rob Roth, *AccessComputing Staff*

Five deaf and hard-of-hearing students from California, Iowa, Minnesota, Pennsylvania, and Washington attended a one-week Summer Computing Experience at the University of Washington. This was an opportunity for high school students to experience what computing is all about. They went on field trips to Adobe, Google, Valve, and Microsoft's Home of the Future and had fun learning about Seattle on the famous Ride the Ducks tour.

Every morning the students attended an animation class and learned basic animation techniques, as well as the programming

aspects behind animation cells. They also met the three principals of DeafCode and learned about entrepreneurship in computing. Motivated by this exciting introduction, some participants are now thinking about applying for the 2010 Summer Academy!

WebAnywhere: Accessible Accessibility

by Brian King, *AccessComputing* Staff

For a person with a visual impairment, a computer can initially present some accessibility challenges. However, there are a wide variety of software products available to help people of all abilities access and use a computer. One of the more popular products for people with visual impairments is a screen reader that uses a digital voice to read aloud text that appears on a computer screen. While a very helpful tool in making a specific computer accessible, screen readers are not always installed on public computers in libraries and Internet cafés.

To make speech output available on any computer at any time, University of Washington alumnus Jeffrey Bigham developed WebAnywhere. Anyone can use this product with almost any web browser and operating system, without the need for additional software. WebAnywhere even predicts web content that may interest the user based on the individual's past history, and it pre-loads speech patterns allowing instant audio access to on-screen content.

Unlike many screen readers, WebAnywhere is free of charge. It can be accessed from <http://webanywhere.cs.washington.edu/>.

Bigham was recognized as one of *Technology Review's* 2009 Young Innovators Under 35 for his creation of WebAnywhere and is currently an assistant professor in the Computer Science department at the University of Rochester.

Communities of Practice

by Sheryl Burgstahler, *AccessComputing* PI and Co-Director

AccessComputing engages stakeholders through a variety of ways, including Communities of Practice (CoPs). CoP members communicate using email and other electronic tools. They share perspectives and expertise and identify practices that promote the participation of people with disabilities in computing fields. Five project CoPs are described below.

- The **Computing Faculty, Administrator, and Employer CoP** engages computing professionals, faculty, and administrators, as well as representatives from industry and professional organizations, with the goal to increase their knowledge about disabilities and make changes in computing departments that lead to more inclusive practices.
- The **Broadening Participation CoP** connects collaborators who administer alliances and projects that serve to broaden participation in computing fields.
- The **Disability Services CoP** connects disability service professionals from community/technical colleges, four-year colleges, and universities nationwide, together with their networks of postsecondary and K-12 schools (e.g., affiliates of AHEAD) and parent groups (e.g., affiliates of PACER).
- The **Deaf and Hard of Hearing CoP** connects existing practitioners and networks that support individuals who are deaf or hard of hearing and are interested in increasing the representation of these individuals in computing fields. It includes researchers; college educators; K-12 teachers; and representatives of networks of professional organizations, parent groups, and precollege and postsecondary

institutions that have special programs for students who are deaf and hard of hearing.

- The **Blind and Low Vision CoP** connects practitioners who support individuals who are blind or have low vision. Members include researchers, college educators, high school teachers, schools for the visually impaired, and professional organizations.

To join an *AccessComputing* CoP, send your name, position/title, institution, postal address, email address, and which of the five CoPs you would like to join to accesscomp@uw.edu.

AccessComputing Interns help high school students at a virtual reality workshop.

AccessComputing Internships

by Scott Bellman, *AccessComputing* Staff

There are a lot of great reasons for you to work as an intern while you are in college. You'll gain confidence, develop new skills, and improve your resume. You can improve work habits and learn what jobs you may want (or may want to avoid) after graduation.

Employers want experience! They also want to be able contact your former supervisors and hear about your work as they seek out the best and brightest workers. DO-IT's *AccessComputing* project has helped more than fifty students land paid internship positions in the last year. Some interns also received college credit for their work.

Interns have worked on computer programming, computing research, and in various workshops and labs. Some specific examples of paid internships completed by *AccessComputing* interns include

- Manager of an assistive technology lab.
- Researcher on iPhone accessibility.
- Microsoft "College Intern Program" participant.
- Computing intern at NASA.
- Computing instructor at a large library.
- Graphic design intern for *Popular Science* magazine.
- Google programmer.
- Lab instructor for a digital arts project.

Computing students with disabilities nationwide are encouraged to contact DO-IT about paid internships. Opportunities include computing research on college campuses, computing projects for companies, and opportunities to work for government agencies and non-profit organizations. Request more information by sending a message to doit@uw.edu.

Programming Instant Messaging is a Slam!

by Brian King, *AccessComputing* Staff

Youth Slam—an annual, week-long academy for students who have visual impairments—was held this summer at the University of Maryland. Youth Slam is sponsored by the National Federation of the Blind and its goal is to encourage students with visual impairments to seek out and explore careers in the fields of science, technology, engineering, and math. Attendees participated in a number of activities over the course of the week and were mentored by adults with visual impairments.

As a part of the event, Dr. Richard Ladner led an introductory workshop to computer programming using instant messaging

chatbots. A chatbot is a type of computer program used by many of the Internet-based instant messaging services. A total of fifteen students and five mentors, all with visual impairments, participated in the workshop. Participants built their own chatbots and presented them to the group at the conclusion of the workshop. The students also learned about computer science careers, interviewed three students and mentors who have visual impairments, and participated in a sorting activity using the Computer Science Unplugged curriculum. These educational tools helped students learn about the behind-the-scenes work involved in computer programming.

Responses to the workshop were overwhelmingly positive. One undergraduate student remarked, “It was the most important thing that I’ve ever done.”

Technology and Disability in the Developing World

by Wendy Chisholm, *AccessComputing* Staff

Several participants in the *AccessComputing* project, including three *AccessComputing* Team members, presented at the Technology and Disability in the Developing World conference held at the University of Washington (UW) this fall. The presentation was coordinated through Change, a UW group that explores how technology can improve the lives of underserved populations in the developing world.

Conference topics included the following:

- Overview of the distribution of people with disabilities and of computer and mobile technologies for people with disabilities in developing countries.
- Discussion of low-cost technologies, universal design possibilities, and the role of advocacy groups in technology adoption.

- Clarification of the basic technological status of people with disabilities around the world in order to see how this topic fits into larger political, social, and research agendas.
- Discussion of essential computer access technologies for people who are blind that included access barriers and potential solutions.
- Discussion of natural signed language as an important and relatively inexpensive strategy for people who are deaf.
- Review of deaf technology around the world, its current usages, and its potential in the developing world.
- High-level overview of current speech-based technologies and interaction methods, and how they may apply to people with motor impairments or in hands-busy situations in the developing world.
- Information regarding how people with disabilities use mobile phones to enhance independence.

For more information, consult <http://change.washington.edu/access/>.

Robots and Sound Studied in Engineering Labs

by Scott Bellman, *AccessComputing* Staff

In fall 2009, seven students with disabilities came to the University of Washington’s College of Engineering to attend learning labs. The five high school and two college students met with graduate students and the associate dean to learn about different kinds of signal processing. Students split into two groups to complete one of two laboratory experiments.

One of the labs, “Sounds You Can See,” allowed the students to work on powerful data-crunching computers in the Electrical Engineering department. The students learned how computers process sound and

how to recognize sound patterns through the use of visual graphs. Students manipulated different sounds to create unique soundbites.

The second lab, "Understanding Robot Movement," required students to upload data to underwater robots and make observations about their movements. The robots helped students understand how aquatic creatures move through water.

Check the campus calendar at local schools to find out about events of interest to you. Watch for open houses and other activities that are open to the public.

Program participant Marco studies sound using graphs.

Working Toward an Accessible Web

by Tamitha Tidwell, *AccessComputing* Staff

In summer 2009, a dozen students attended a five-day Web Accessibility Workshop to learn how to evaluate the accessibility of websites and computer applications. Wendy Chisholm was the instructor. The students spent time discussing what it means for technology to be accessible and developed a set of criteria to measure the accessibility of a website. After measurable criteria were determined, the students learned about a variety of tools that are used to determine accessibility. Finally, students learned how to document their test results to provide constructive feedback to

website developers and managers. Throughout the workshop, students evaluated actual websites to determine their accessibility. The class curriculum is available at <https://files.getdropbox.com/u/3401/doit-wat/unit%201/module%201/lesson1.html>.

A few students were selected to become paid *Interns*. The *Interns* evaluated the accessibility of twenty-five different academic computing departments' websites. These websites had been evaluated several years prior to the 2009 *Interns*' evaluation. The goal was to determine if the websites had become more or less accessible, or if there had been no change since the previous evaluation. Findings from this evaluation will be sent to the website managers. The evaluation form is available at <http://spreadsheets.google.com/viewform?hl=en&f ormkey=dDB3NVliOXVUN05obzR0bDBJV1o4UIE6MA>.

If you would like the accessibility of your website evaluated, contact Wendy Chisholm at chiswa@uw.edu.

Talking Points: Universal Design

by Wendy Chisholm, *AccessComputing* Staff

This summer, KUOW (Puget Sound Public Radio) broadcast my interview with Jeannie Yandel. We discussed universal design and its benefit for everyone, including people with disabilities. The segment, "Web Accessibility for Everyone" is available at <http://www.kuow.org/program.php?id=18043>. A transcript is available at <http://sp1ral.com/2009/08/interview-transcript/>.

This fall, Minnesota Public Radio's John Moe talked to Darren Burton from the American Foundation for the Blind and myself about technology and disability. I enjoyed our discussion and was happy that we talked about challenging people's assumptions. A recording of the radio program is available at <http://minnesota.publicradio.org/display/web/2009/09/23/midmorning2/>.

HTML5 Super Friends

By Wendy Chisholm, *AccessComputing* Staff

The next wave of HTML, called HTML5, is in development by the Web Hypertext Application Technology Working Group (WHATWG) and the World Wide Web Consortium (W3C). HTML5 is an important step for web accessibility, because it is the first time that people with disabilities have been included in the web language development process from the beginning. Two very different cultures are learning how to work together, and it's both exciting and frustrating.

Accessibility advocates are educating engineers about the technological needs of people with disabilities. Although the engineers can be hard to convince, when they "get it," they often come up with very cool solutions. [See the complete article in the expanded version of *AccessComputing News* at www.uw.edu/accesscomputing/jan10_index.html.]

Top Ten Degrees

by Scott Bellman, *AccessComputing* Staff

Do you know which college degrees are in high demand? In a recent survey* the top ten in-demand college degrees reported by respondents are:

1. accounting
2. mechanical engineering
3. electrical engineering
4. computer science
5. business administration/management
6. economics/finance
7. information sciences & systems
8. computer engineering
9. management information systems
10. marketing/marketing management

Four out of ten, a whopping 40%, are computer science degrees! That means when students invest their time and money in computing degrees, they are making a

good investment. Employers need to find computing graduates to keep their businesses running. This trend is projected to continue well into the future.*Source: Job Outlook 2009, National Association of Colleges and Employers

***AccessComputing* Minigrants**

by Sheryl Burgstahler, *AccessComputing* PI and Co-Director

The following institutions have received funding through *AccessComputing* to increase the participation of people with disabilities in IT and computing fields. See the expanded online version of this newsletter for descriptions of the funded activities at www.uw.edu/accesscomputing/jan10_index.html.

- Auburn University (3)
- Boise State University
- Carnegie Mellon University
- Commonwealth Alliance for Information Technology Education
- Eastern Idaho Technical College (5)
- Florida State University
- Georgia State University
- Missouri Southern State University
- Rochester Institute of Technology (2)
- Southern Oregon University
- University of Maryland-Baltimore County
- University of Rhode Island
- University of Southern Maine (2)
- University of Washington (2)
- University of Wisconsin-Madison

Participants in a computing workshop learn how to design accessible technology.
